

The Shortstop strategy - Poa control in bentgrass

Shortstop 200SC

Apply monthly between March and September to suppress poa when it is most problematic. Shortstop not only suppresses poa development, it stops seedlings before they get started. Application rates are dependant on sward composition - consult your Living Turf representative.

Vitalise

Enhance root development with this blend of naturally derived plant substances. Apply at 20L per hectare per month as a foliar and (tank mix with SP Bentgrass, Primo or fungicides).

SP Bentgrass

Complete N, P, K and trace elements in a highly efficient water soluble fertiliser. Apply as a foliar for best results (tank mix with Vitalise, Primo or fungicides). Rate is dependant on climate and desired growth response - consult your Living Turf representative.

SoCal Mag

Balanced Calcium (12%) and Magnesium (3%) for recharging cation exchange in sand greens.

Renoblen

Available carbon is essential for bentgrass health. Renoblen contains dust free granular carbon, wetting agent, slow release N, P, K and trace elements. Apply at 500kg per hectare during renovation.

Sierraform GT

Solid nutritional package to have turf growing into renovation for speedy recovery. A selection of analyses feature slow release, fused potassium silicate. Apply 250kg per hectare for 4-6 weeks growth response.

Primo

Strengthen bentgrass in summer, increase speed, reduce thatch and limit turf stress. Primo works hand in glove with Shortstop to fight poa. Rate tracking should match bentgrass growth and development - consult your Living Turf representative.

Ask us about

- ✓ Enhancing soil biology with beneficial microbes (eg. trichoderma, bacillis),
- ✓ Controlling seed head to eliminate future generations of Poa annua,
- ✓ Syngenta Greensure plans, to minimise downtime from insects and disease,
- ✓ New Aquaforte technology, which reduces the severity of the soil drying cycle.
